INSTRUCTIONS FOR USE

Recommended Mixing and Diluting

INITIAL MARKING

OVER MARKING

10L XTREME MAKES UP TO
160L LINE MARKING LIQUID

Procedure for Successful Line Marking

Please follow these simple steps to ensure trouble-free line marking:

1. Open concentrated pail and check consistency. Using a 'plunger-style' mixer, ensure paint is mixed for a minimum of 1 minute until a smooth and 'runny' consistency is achieved.
2. Dilute liquid to the recommended ratio in a separate container by using the recommended amount of clean water and straining the recommended amount of liquid into water. Once again mix for a minimum of 1 minute with a 'plunger-style' mixer ensuring the liquid is completely dispersed through the water/liquid mix.
3. Carefully strain the liquid mix into Line Marker and begin to mark.
4. Once line marking has been completed, remove liquid from the Line Marker and store in airtight container for next use. If you intend to reuse the liquid, please ensure above mixing technique is used prior to use.
5. Use stored paint within 6 months of purchase.

Do

- ✓ Mix concentrated liquid prior to use as per instructions.
- ✓ Dilute with clean water in a separate container.
- ✓ Use a strainer when transferring liquid from the container to a mixing bucket and then to the Line Marker.
- ✓ Dilute at recommended ratio. Avoid Line Marker blockages by using the recommended ratios of water and concentrate. Stronger mixes for initial 3 or 4 markings are recommended, as this will improve durability.
- ✓ Keep the dilution more concentrated when marking on wet turf.
- ✓ Completely FLUSH Line Marker after every use, and if at idle.

Don't

- ✗ Use liquid without correct mixing and dilution – refer to instruction above.
- ✗ Dilute liquid in the Line Marker without removing internal filter first (ONLY FOR LINE MARKERS FITTED WITH 'QUICKMIX' SYSTEM).
- ✗ Mark on uncut turf. Ideal cut height 15mm to 30mm.
